Contents

1 The VDedgeDrawn object

A `VDedgeDrawn` object encodes a description of an edge. It has two subclasses, representing polygons and circular segments. Edges are unique. If two set boundaries overlap they are described by a common edge on the overlap. The orientation of an edge is important. An edge whose name starts with a '-' is interpreted as the reversal of the edge with the same name without the '-' (and only the latter is stored in the diagram's list of edges). Edge names are unique.

Most edges form the boundaries of both Faces and Sets. The exception is invisible edges which are added between otherwise disjoint sets to ensure the diagram is not disjoint.

1.1 The VDedgeSector object

A `VDedgeSector` object inherits from a `VDedgeDrawn` one. A sector is a segment of a circle, defined by two points, together with the convention that a right-handed sector goes clockwise (Figure 1). Angles are all interpreted in the same way as `atan2`, ie clockwise from the line $y = 0$. The angles of the beginning θ_f and end θ_t of the segment obey $2\pi \geq \theta_f > 0$ and $\theta_f > \theta_t > -2 * \pi$.

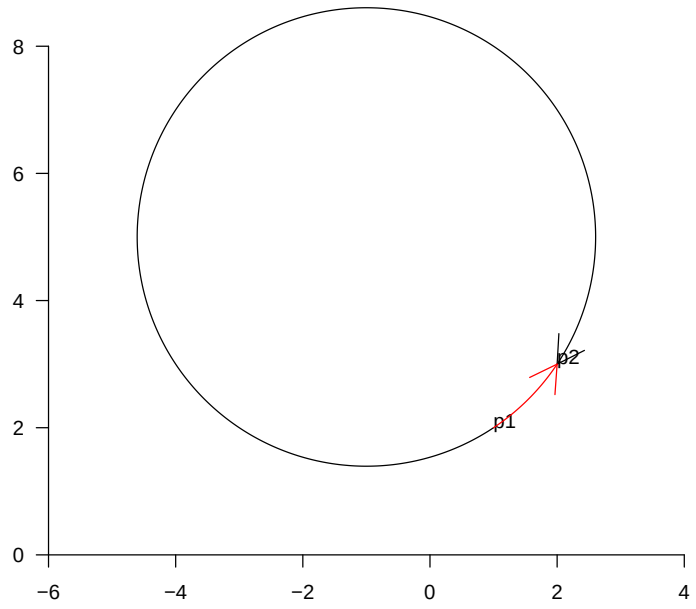

Figure 1: In black, a right-handed edge sector, and in red a left-handed one

1.2 The VDedgeLines object

A `VDedgeSector` object inherits from a `VDedgeDrawn` one and describes polygonal edges.

1.3 Edge methods

Edges can be shown, split at a point, converted to *xy* coordinates, or reversed. It can have a 'midpoint' found on its interior. A point can be tested to see if it lies on an edge. Pairs of edges can be tested for identity, joined together (not much used and barely tested), and crucially can be tested for intersection.

2 Faces

Individual faces within a diagram are stored as a vector of edge names describing an oriented traversal of the face.

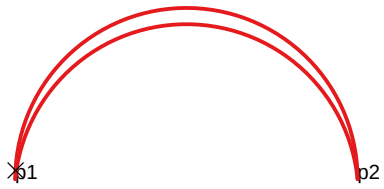

Figure 2: A face which doesn't contain its centroid

.

3 Joining disjoint faces

```
> VD2 <- compute.Venn(Venn(n = 2))
> VD3 <- newTissueFromCircle(centre.xy = c(2, 0), radius = 0.6,
```

```
+     Set = 3)
> VD23 <- VD2
> VD23@faceList <- c(VD2@faceList, VD3@faceList)
> VD23@edgeList <- c(VD2@edgeList, VD3@edgeList)
> VD23@setList <- c(VD2@setList, VD3@setList)
> grid.newpage()
> pushViewport(plotViewport(c(1, 1, 1, 1)))
> makevp.eqsc(c(-2, 3), c(-2, 2))
> grid.xaxis()
> grid.yaxis()
> PlotSetBoundaries(VD23)
> drawing <- VD23
> innerFaceName <- "1"
> .create.edge.joining.faces(drawing, "DarkMatter", "1")
